## Problem Set 1

Problem 1. The wave function for a free particle is given by

$$\psi(x, 0) = N \exp\left(i\frac{p_0 x}{\hbar} - \frac{(x - x_0)^2}{4\sigma^2}\right),\,$$

where  $\sigma \in \mathbb{R}$  is a contant and N is a normalization constant.

- (1) Derive the normalization constant N.
- (2) Derive the wave function  $\phi(0,0)$  in momentum space.
- (3) Find  $\phi(p, t)$ .
- (4) Find  $\psi(xt)$ .
- (5) Show that the spread in the spatial probability distribution increases with time t. Note that the spread is defined as

$$S(t) = \frac{|\psi(x, t)|^2}{|\psi(0, t)|^2}.$$

## Solution

(1) From the normalization of the wave function,

$$\int_{-\infty}^{\infty} |\psi(x,0)|^2 dx = N^2 \int_{-\infty}^{\infty} \exp\left(-2\left(\frac{x-x_0}{2\sigma}\right)^2\right) dx = 1.$$
 (1)

Since a range of integration is all space, the translation about x can be ignored. To make a compact form, it needs to change an integral variable.

$$t \equiv \left(\frac{x - x_0}{\sqrt{2}\sigma}\right), \quad dt = \frac{1}{\sqrt{2}\sigma}dx$$
 (2)

Then the wave function changes into more comfort form to integrate.

$$N^2 \int_{-\infty}^{\infty} \exp\left(-2\left(\frac{x-x_0}{2\sigma}\right)^2\right) dx = \sqrt{2}\sigma N^2 \int_{-\infty}^{\infty} e^{-t^2} dt$$
 (3)

<sup>\*</sup>Electronic address: hchkim@inha.ac.kr

To calcualte this integration, we use a idea of double integration,

$$\int_{-\infty}^{\infty} e^{-(x^2 + y^2)} dx dy = \int_{0}^{2\pi} \int_{0}^{\infty} e^{-r^2} r dr d\theta$$
 (4)

$$= \int_0^{2\pi} \frac{1}{2} \, d\theta = \pi. \tag{5}$$

First double integration about coordinate space can be decomposed.

$$\int_{-\infty}^{\infty} e^{-(x^2 + y^2)} dx dy = \int_{-\infty}^{\infty} e^{-x^2} dx \int_{-\infty}^{\infty} e^{-y^2} dy = \left( \int_{-\infty}^{\infty} e^{-x^2} dx \right)^2$$
 (6)

From this result,

$$\int_{-\infty}^{\infty} e^{-x^2} dx = \sqrt{\pi}, \quad \sqrt{2\pi}\sigma N^2 = 1.$$
 (7)

Finally we obtain the normalization constant,

$$N = \left(\frac{1}{2\pi\sigma^2}\right)^{\frac{1}{4}}.\tag{8}$$

(2) We will find  $\phi(p,0)$  first.  $\phi(p,0)$  is the Fourier transform of  $\psi(x,0)$ .

$$\phi(p,0) = \frac{1}{\sqrt{2\pi\hbar}} \int \psi(x,0) e^{-\frac{i}{\hbar}px} dx = \frac{N}{\sqrt{2\pi\hbar}} \int \exp\left(i\frac{p_0 x}{\hbar} - \left(\frac{x - x_0}{2\sigma}\right)^2\right) e^{-\frac{i}{\hbar}px} dx \tag{9}$$

$$= \frac{N}{\sqrt{2\pi\hbar}} \int \exp\left(-\left(\frac{x-x_0}{2\sigma}\right)^2 - \frac{i}{\hbar}(p-p_0)x\right) dx \tag{10}$$

To make it compact form, let us erase the translation term and change the variable.

$$u \equiv \frac{x - x_0}{2\sigma}, \quad du = \frac{1}{2\sigma} dx \tag{11}$$

Then, a  $\phi(p,0)$  is,

$$\phi(p,0) = \frac{2\sigma N}{\sqrt{2\pi\hbar}} \int \exp\left(-u^2 - \frac{i}{\hbar}(p - p_0)(2\sigma u + x_0)\right) du$$
 (12)

$$= \left(\frac{2\sigma^2}{\pi^3 \hbar^2}\right)^{\frac{1}{4}} e^{-\frac{i}{\hbar}(p-p_0)x_0} \int \exp\left(-u^2 - 2\frac{i}{\hbar}\sigma(p-p_0)u\right) du. \tag{13}$$

And, a exponential of integrated function can be expressed in terms of complete square form about u.

$$-u^{2} - 2\frac{i}{\hbar}\sigma(p - p_{0})u = -\left(u + \frac{i}{\hbar}\sigma(p - p_{0})\right)^{2} - \frac{\sigma^{2}}{\hbar^{2}}(p - p_{0})^{2}$$
(14)

 $\frac{i}{\hbar}\sigma p$  is the translation term that can be ignored since the integration range is from  $-\infty$  to  $\infty$ ,

$$\phi(p,0) = \left(\frac{2\sigma^2}{\pi^3 \hbar^2}\right)^{\frac{1}{4}} e^{-\frac{i}{\hbar}(p-p_0)x_0} \int \exp\left(-u^2 - 2\frac{i}{\hbar}\sigma(p-p_0)u\right) du$$
 (15)

$$= \left(\frac{2\sigma^2}{\pi^3 \hbar^2}\right)^{\frac{1}{4}} e^{-\frac{i}{\hbar}(p-p_0)x_0} \int \exp\left(-\left(u + \frac{i}{\hbar}\sigma(p-p_0)\right)^2 - \frac{\sigma^2}{\hbar^2}(p-p_0)^2\right) du \tag{16}$$

$$= \left(\frac{2\sigma^2}{\pi^3\hbar^2}\right)^{\frac{1}{4}} \exp\left(-\frac{i}{\hbar}(p-p_0)x_0 - \frac{\sigma^2}{\hbar^2}(p-p_0)^2\right) \int e^{-u^2} du$$
 (17)

So, we obtain a  $\phi(p.0)$ .

$$\phi(p,0) = \left(\frac{2\sigma^2}{\pi^3\hbar^2}\right)^{\frac{1}{4}} \exp\left(-\frac{i}{\hbar}(p-p_0)x_0 - \frac{\sigma^2}{\hbar^2}(p-p_0)^2\right) \int e^{-u^2} du$$
 (18)

$$= \left(\frac{2\sigma^2}{\pi\hbar^2}\right)^{\frac{1}{4}} \exp\left(-\frac{i}{\hbar}(p-p_0)x_0 - \frac{\sigma^2}{\hbar^2}(p-p_0)^2\right)$$
 (19)

Finally,  $\phi(0,0)$  is

$$\phi(0,0) = \left(\frac{2\sigma^2}{\pi\hbar^2}\right)^{\frac{1}{4}} \exp\left(-\frac{\sigma^2}{\hbar^2}p_0^2 + \frac{i}{\hbar}p_0x_0\right). \tag{20}$$

(3) Because it is a free particle, the time evolution of  $\phi(p,0)$  is  $\phi(p,t)=e^{-i\omega t}\phi(p,0)$  and  $\omega=\frac{p^2}{2m\hbar}$ .

$$\phi(p,t) = \left(\frac{2\sigma^2}{\pi\hbar^2}\right)^{\frac{1}{4}} \exp\left(-\frac{\sigma^2}{\hbar^2}(p-p_0)^2 - i\frac{p^2}{2m\hbar}t - \frac{i}{\hbar}(p-p_0)x_0\right)$$
(21)

$$= \left(\frac{2\sigma^2}{\pi\hbar^2}\right)^{\frac{1}{4}} \exp\left(-\left(\frac{\sigma^2}{\hbar^2} + \frac{it}{2m\hbar}\right)p^2 + \left(\frac{2\sigma^2}{\hbar^2}p_0 - \frac{i}{\hbar}x_0\right)p - \frac{\sigma^2}{\hbar^2}p_0^2 - \frac{i}{\hbar}p_0x_0\right)$$
(22)

$$= \left(\frac{2\sigma^2}{\pi\hbar^2}\right)^{\frac{1}{4}} \exp\left(-\frac{2m\sigma^2 + i\hbar t}{2m\hbar^2}p^2 - \frac{2\sigma^2 p_0 - i\hbar x_0}{\hbar^2}p - \frac{\left(\sigma^2 p_0 + i\hbar x_0\right)p_0}{\hbar^2}\right) \tag{23}$$

The complete square form of  $\phi(p,t)$  is,

$$\phi(p,t) = \left(\frac{2\sigma^2}{\pi\hbar^2}\right)^{\frac{1}{4}} \exp\left(-\frac{2m\sigma^2 + i\hbar t}{2m\hbar^2}p^2 - \frac{2\sigma^2 p_0 - i\hbar x_0}{\hbar^2}p - \frac{\left(\sigma^2 p_0 + i\hbar x_0\right)p_0}{\hbar^2}\right)$$
(24)

$$= \left(\frac{2\sigma^2}{\pi\hbar^2}\right)^{\frac{1}{4}} \exp\left(\alpha(t)\left(p + \beta(t)\right)^2 + \gamma(t)\right) \tag{25}$$

$$\alpha(t) = -\frac{2m\sigma^2 + i\hbar t}{2m\hbar^2}, \quad \beta(t) = \frac{2m\sigma^2 p_0 - im\hbar x_0}{2m\sigma^2 + i\hbar t}, \tag{26}$$

$$\gamma(t) = \frac{-mx_0 \left(\frac{1}{2}\hbar x_0 + 4i\sigma^2 p_0\right) - (\hbar x_0 - i\sigma^2 p_0)p_0 t}{2m\hbar\sigma^2 + i\hbar^2 t}.$$
(27)

(4)

(5)

**Problem 2.** The Hamiltonian for a free particle is given by

$$H = \frac{p^2}{2m}.$$

(1) Show

$$\langle p_x \rangle = \langle p_x \rangle_{t=0}.$$

(2) Show

$$\langle x \rangle = \frac{\langle p_x \rangle_{t=0}}{m} t + \langle x \rangle_{t=0}.$$

(3) Show

$$(\Delta p_r)^2 = (\Delta p_r)_{t=0}^2.$$

(4) Find  $d(\Delta x)^2/dt$  as a function of time and initial conditions.

**Problem 3.** The state of a particle is described by the following wavefunction:

$$\psi(x) = C \exp\left[i\frac{p_0 x}{\hbar} - \frac{(x - x_0)^2}{2\sigma^2}\right]$$

where  $p_0$ ,  $x_0$ , and a are real parameters.

- (1) Find the normalization constant C.
- (2) Find the mean values of x and p.
- (3) Find the standard deviations  $\Delta x$  and  $\Delta p$ .

**Problem** 4\*. Consider a particle and two normalized energy eigenfunctions  $\psi_1(\mathbf{x})$  and  $\psi_2(\mathbf{x})$  corresponding to the eigenvalues  $E_1 \neq E_2$ . Assume that the eigenfunctions vanish outside the two non-overlapping regions  $\Omega_1$  and  $\Omega_2$ , respectively.

- (1) (a) Show that, if the particle is initially in region  $\Omega_1$  then it will stay there forever.
- (b) If, initially, the particle is in the state with wave function

$$\psi(\boldsymbol{x}, 0) = \frac{1}{\sqrt{2}} [\psi_1(\boldsymbol{x}) + \psi_2(\boldsymbol{x})]$$

show that the probability density  $|\psi(x,t)|^2$  is independent of time.

- (c) Now assume that the two regions  $\Omega_1$  and  $\Omega_2$  overlap partially. Starting with the initial wave function of case (b), show that the probability density is a periodic function of time.  $(E_2 E_1 = \hbar\omega)$ .
- (d) Starting with the same initial wave function and assuming that the two eigenfunctions are real and isotropic, take the two partially overlapping regions  $\Omega_1$  and  $\Omega_2$  to be two concentric spheres of radii  $R_1 > R_2$ . Compute the probability current that flows through  $\Omega_1$ .

(Problem 4 is a bit difficult. To solve (3), introduce phase factors for  $\psi_1(\mathbf{x})$  and  $\psi_2(\mathbf{x})$  and consider the interference term when one computes the probability density. To solve (4), consider the current density and continuity equation.
